# 1. Communication Bus Parameters and Message Format 1.1.CAN Bus

#### 1.1.1. Parameters

Bus interface: CAN Baud rate: 1Mbps

# 1.1.2. Message format

Identifier: Single motor command sending:  $0x140 + ID(1\sim32)$ 

Multi-motor command sending: 0x280

Reply: 0x240 + ID (1~32) Frame format: data frame Frame Type: Standard Frame

DLC: 8 bytes

# 1.2.RS485 bus

#### 1.2.1. Parameters

Bus interface: RS485

Baudrate:115200bps, 500Kbps, 1Mbps

# 1.2.2. Message format

Туре	Data Defination	Bytes	Description
Frame header	0x3E	1	Communication frame header, used for identification.
ID	1~32	1	Device address, corresponding to the ID number of each motor.
Data Length	Data Length	1	The length of the data field. In the standard protocol, the length is fixed to 8 bytes.
Data field	Data content	According to the length	The content of the data field in the standard protocol is exactly the same as that of the CAN.
Check	CRC Check	2	CRC16 check, low order first, high order last.

# 2. Single motor command description

# 2.1. Read PID parameter command (0x30)

# 2.1.1. Instruction description

This command can read the parameters of current, speed, position loop KP and KI at one time, and the data type is uint8\_t. The system sets the maximum range of PI parameters according to the motor model, and then divides it equally according to the maximum range of uint8\_t of 256 units. Users only need to adjust 0-256 units.

## 2.1.2. Send data field definition

## **Description:**

Data[2] represents the current loop KP parameter, 0x55 decimal represents 85, assuming that the maximum value of the current loop set by the system is 3, then the actual value of 1 unit is 3/256 = 0.01171875, and 85 units represent the actual value 85\*0.01171875 = 0.99609375, which is the actual value of the KP parameter of the current loop inside the system.

Data[3] represents the current loop KI parameter, 0x19 decimal represents 25, assuming that the maximum value of the current loop set by the system is 0.1, then the actual value of 1 unit is 0.1/256 = 0.00039062, and 25 units represent the actual value of 25\*0.00039062 = 0.0097656, which is the actual value of the KI parameter of the current loop inside the system.

Data[4] represents the KP parameter of the speed loop, and 0x55 in decimal represents 85. Assuming that the maximum value of the speed loop set by the system is 0.1, the actual value of 1 unit is 0.1/256 = 0.00039062, and 85 units represent the actual value of 85\* 0.00039062 = 0.0332027, this is the actual value of the KP parameter of the internal speed loop of the system.

Data[5] represents the speed loop KI parameter, 0x19 decimal represents 25, assuming that the maximum speed loop set by the system is 0.01, then the actual value of 1 unit is 0.01/256 = 0.00003906, and 25 units means the actual value is 25\*0.00003906 = 0.0009765, this is the actual value of the KI parameter of the speed loop inside the system.

Data[6] represents the KP parameter of the position loop, 0x55 in decimal means 85, assuming that the maximum value of the position loop set by the system is 0.1, then the actual value of 1 unit is 0.1/256 = 0.00039062, and 85

units means the actual value is 85\* 0.00039062 = 0.0332027, this is the actual value of the KP parameter of the internal position loop of the system.

Data[7] represents the position loop KI parameter, 0x19 decimal represents 25, assuming that the maximum value of the position loop set by the system is 0.01, then the actual value of 1 unit is 0.01/256 = 0.00003906, and 25 units means the actual value is 25\* 0.00003906 = 0.0009765, which is the actual value of the KI parameter of the internal position loop of the system.

# 2.2. Write PID parameters to RAM command (0x31)

## 2.2.1. Instruction description

This command can write the parameters of current, speed, position loop KP and KI to RAM at one time, and it will not be saved after power off. The data type is uint8\_t. The system sets the maximum range of PI parameters according to the motor model, and then divides it equally according to the maximum range of uint8\_t of 256 units. Users only need to adjust 0-256 units.

#### 2.2.2. Send data field definition

Data field	Description	Data
DATA[0]	Command byte	0x31
DATA[1]	NULL	0x00
DATA[2]	Current loop KP parameter	DATA[2] = (uint8_t)(CurrKP)
DATA[3]	Current loop KI parameter	DATA[3] = (uint8_t)(CurrKI)
DATA[4]	Speed loop KP parameter	$DATA[4] = (uint8\_t)(SpdKP)$
DATA[5]	Speed loop KI parameter	DATA[5] = (uint8_t)(SpdKI)
DATA[6]	Position loop KP parameter	DATA[6] = (uint8_t)(PosKP)
DATA[7]	Position loop KI parameter	DATA[7] = (uint8_t)(PosKI)

#### 2.2.3. Reply data field definition

The content of the reply data is the same as the sent data.

#### 2.2.4. Communication example

# Example 1:

Send command:

#### CAN:

# 2.3. Write PID parameters to ROM command (0x32)

# 2.3.1. Instruction description

This command can write the parameters of current, speed, position loop KP and KI to ROM at one time, which can be saved after power off. The data type is uint8\_t. The system sets the maximum range of PI parameters according to the motor model, and then divides it equally according to the maximum range of uint8 t of 256 units. Users only need to adjust 0-256 units.

### **Description:**

Data[1] = 0x32 is 50 in decimal, which means the motor temperature is 50 degrees at the moment. The composite data of Data[2] and Data[3] 0x0064 is 100 in decimal, and it is 100\*0.01=1A when scaled down by 100 times, which means that the actual current of the current motor is 1A. The composite data 0x01F4 of Data[4] and Data[5] is 500 in decimal, which means the motor output shaft speed is 500dps. There is a reduction ratio relationship between the motor output shaft speed and the motor speed. If the reduction ratio is 6, then the motor speed is 6 times higher than the output shaft speed. The composite data of Data[6] and Data[7] 0x002D is 45 in decimal, which means that the motor output shaft moves 45 degrees in the positive direction relative to the zero position. The position of the motor output shaft is related to the number of lines of the motor encoder and the reduction ratio. For example, if the number of lines of the motor output shaft corresponds to 65536\*6 = 393216

pulses.

# 2.14. Read Motor Status 3 Command (0x9D)

# 2.14.1. Instruction description

This command reads the current motor temperature and phase current data

#### 2.14.2. Send data field definition

# 2.19. Absolute position closed-loop control command (0xA4)

#### 2.19.1. Instruction description

This command is a control command, which can be run when the motor is not faulty. The host sends this command to control the position of the motor (multi-turn angle). The control value angleControl is int32\_t type, and the corresponding actual position is 0.01degree/LSB, that is, 36000 represents 360°, and the rotation direction of the motor is determined by the difference between the target position and the current position. The control value maxSpeed limits the maximum speed of the motor output shaft rotation, which is of type uint16 t, corresponding to the actual speed of 1dps/LSB.

#### 2.19.2. Send data field definition

#### **Description:**

Data[1] = 0x32 is 50 in decimal, which means the motor temperature is 50 degrees at the moment. The composite data of Data[2] and Data[3] 0x0064 is 100 in decimal, and it is  $100^*0.01=1A$  when scaled down by 100 times, which means that the actual current of the current motor is 1A. The composite data 0x01F4 of Data[4] and Data[5] is 500 in decimal, which means the motor output shaft speed is 500dps. There is a reduction ratio relationship between the motor output shaft speed and the motor speed. If the reduction ratio is 6, then the motor speed is 6 times higher than the output shaft speed. The composite data of Data[6] and Data[7] 0x002D is 45 in decimal, which means that the motor output shaft moves 45 degrees in the positive direction relative to the zero position. The position of the motor output shaft is related to the number of lines of the motor encoder and the reduction ratio. For example, if the number of lines of the motor output shaft corresponds to 65536\*6 = 393216 pulses.

#### **Description:**

Data[1] = 0x32 is 50 in decimal, which means the motor temperature is 50 degrees at the moment. The composite data of Data[2] and Data[3] 0xFF9C is -100 in decimal, and it is -100\*0.01=-1A when scaled down by 100 times, which means that the actual current of the current motor is -1A. The composite data 0xFE0C of Data[4] and Data[5] is -500 in decimal, which means the motor output shaft speed is -500dps. There is a reduction ratio relationship between the motor output shaft speed and the motor speed. If the reduction ratio is 6, then the motor speed is 6 times higher than the output shaft speed. The composite data of Data[6] and Data[7] 0xFFD3 is -45 in decimal, which means that the motor output shaft moves in the opposite direction by -45 degrees relative to the zero position. The position of the motor output shaft is related to the number of lines of the motor encoder and the reduction ratio. For example, if the number of lines of the motor output shaft corresponds to 65536\*6 = 393216 pulses.

# 2.20. Incremental position closed-loop control command (0xA8)

#### 2.20.1. Instruction description

This command is a control command, which can be run when the motor is not faulty. The host sends this command to control the incremental position (multi-turn angle) of the motor, and run the input position increment with the current

position as the starting point. The control value angleControl is of type int32\_t, and the corresponding actual position is 0.01degree/LSB, that is, 36000 represents 360°, and the rotation direction of the motor is determined by the incremental position symbol.

The control value maxSpeed limits the maximum speed of the motor output shaft rotation, which is of type uint16\_t, corresponding to the actual speed of 1dps/LSB.

#### 2.20.2. Send data field definition

#### **Description:**

Data[4] to Data[7] (Data[4] is low and Data[7] is high) = 0x10000000, decimal 268435456, indicating that the system has run for 268435456ms after restarting or resetting, about 74 Hour.

# 2.27. System software version date read command (0xB2)

## 2.27.1. Instruction description

This command is used to get the update date of the system software version.

#### 2.27.2. Send data field definition

data field	Description	data
DATA[0]	command byte	0xB2
DATA[1]	NULL	0x00
DATA[2]	NULL	0x00
DATA[3]	NULL	0x00
DATA[4]	NULL	0x00
DATA[5]	NULL	0x00
DATA[6]	NULL	0x00
DATA[7]	NULL	0x00

# 2.27.3. Reply data field definition

The motor will reply to the host after receiving the command. The driver reply data contains the latest version date of the system software, VersionDate, which is of type uint32\_t. The date format is in the format of year, month, and day, such as 20211126.

data field	Description	data
DATA[0]	command byte	0xB2
DATA[0]	NULL	0x00
DATA[0]	NULL	0x00
DATA[0]	NULL	0x00

DATA[4]	VersionDate low byte1	DATA[4] = (uint8_t)(&VersionDate)
DATA[5]	VersionDate byte2	DATA[5] = (uint8_t)(VersionDate>>8)
DATA[6]	VersionDate byte3	DATA[6] = (uint8_t)(VersionDate>>16)
DATA[7]	VersionDate byte4	DATA[7] = (uint8_t)(VersionDate>>24)

## 2.27.4. Communication example

## Example 1:

#### Send command:

#### CAN:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[3] Data[4]		Data[6]	Data[7]
0x141	0xB2	0x00	0x00	0x00	0x00	0x00	0x00	0x00

#### RS485:

#### **Description:**

Data[4] to Data[7] (Data[4] is low and Data[7] is high) = 0x0134892E, decimal 20220206, indicating that the software version date is February 6, 2022.

# 2.28. Communication interruption protection time setting command (0xB3)

# 2.28.1. Instruction description

This command is used to set the communication interruption protection time in ms. If the communication is interrupted for more than the set time, it will cut off

the output brake lock. To run again, you need to establish stable and continuous communication first. Writing 0 means that the communication interruption protection function is not enabled.

#### 2.28.2. Send data field definition

data field	Description	data
DATA[0]	command byte	0xB3
DATA[1]	NULL	0x00
DATA[2]	NULL	0x00
DATA[3]	NULL	0x00
DATA[4]	CanRecvTime_MS low byte1	DATA[4] = (uint8_t)(CanRecvTime_MS)
DATA[5]	CanRecvTime_MS byte2	DATA[5] = (uint8_t) (CanRecvTime_MS>>8)
DATA[6]	CanRecvTime_MS byte3	DATA[6] = (uint8_t) (CanRecvTime_MS>>16)
DATA[7]	CanRecvTime_MS byte4	$DATA[7] = (uint8_t)$ (CanRecvTime_MS>>24)

#### 2.28.3. Reply data field definition

The motor replies to the host after receiving the command, and the frame data is the same as the command sent by the host.

# 2.28.4. Communication example

#### Example 1:

#### Send command:

#### CAN:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0xB3	0x00						

#### RS485:

frame heade r	ID	Lengt h	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16 H
0x3E	0x01	0x08	0xB3	0x00	CRC16	CRC16						
UXSE	OXUI	UXUO	UXDS	UXUU	L	Н						

#### Note:

The data values are all 0, which means that the communication interruption protection function is not enabled. If the communication is interrupted, the motor will continue to execute the current command.

#### Reply command:

#### CAN:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x241	0xB3	0x00

0x3E	0x01	0x08	0xB3	0x00	L	Н						

#### **Description:**

The frame data is the same as the command sent by the host.

## Example 2:

#### Send command:

#### CAN:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0xB3	0x00	0x00	0x00	0xE8	0x03	0x00	0x00

#### RS485:

frame heade r	ID	Lengt h	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16 H
0x3E	0x01	0x08	0xB3	0x00	0x00	0x00	0xE8	0x03	0x00	0x00	CRC16	CRC16
											L	Н

#### **Description:**

Data[4] to Data[7] (Data[4] is low and Data[7] is high) constitute data 0x000003E8, decimal is 1000ms. Indicates that the communication interruption protection time is set to 1000ms, which is stored in the ROM and saved after power failure. Then, if the communication interval exceeds 1000ms, the communication interruption protection will be triggered, and the output lock brake will be cut off. When the communication interval is restored to within 1000ms, normal operation can be resumed.

#### Reply command:

#### CAN:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x241	0xB3	0x00						

#### RS485:

frame heade r	ID	Lengt h	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16 H
0x3E	0x01	0x08	0xB3	0x00	CRC16	CRC16						
											L	Н

#### **Description:**

The frame data is the same as the command sent by the host.

# 2.29. Communication baud rate setting command (0xB4)

#### 2.29.1. Instruction description

This instruction can set the communication baudrate of CAN and RS485 bus. The parameters will be saved in ROM after setting, and will be saved after power off, and will run at the modified baudrate when powered on again.

#### Baudrate:

RS485: 0 represents 115200bps baud rate,

1 stands for 500Kbps baud rate,

2 stands for 1Mbps baud rate,

3 represents 1.5Mbps baud rate,

4 represents 2Mbps baud rate;

CAN: 0 means 500Kbps baud rate,

1 stands for 1Mbps baud rate;

#### 2.29.2. Send data field definition

2.29.2. Gend data neid definition									
Data Field	Description	Data							
DATA[0]	command byte	0xB4							
DATA[1]	NULL	0x00							
DATA[2]	NULL	0x00							
DATA[3]	NULL	0x00							
DATA[4]	NULL	0x00							
DATA[5]	NULL	0x00							
DATA[6]	NULL	0x00							
DATA[7]	baudrate	DATA[7] = (uint8_t)baudrate							

# 2.29.3. Reply data field definition

Since the communication baud rate is modified, the reply command is random and need not be processed.

#### 2.29.4. Communication example

Example 1:

Send command:

#### CAN:

ID NO.	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0xB4	0x00						

#### RS485:

Frame Header	ID NO.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0x01	0x08	0xB4	0x00	CRC16L CRC16H						

Description: Data[7] = 0, which means the baud rate of RS485 is changed to 115200bps, and the baud rate of CAN is changed to 500Kbps.

Example 2:

Send command:

CAN:

ID NO.	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0xB4	0x00	0x00	0x00	0x00	0x00	0x00	0x01

#### RS485:

Frame Header	ID NO.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0x01	0x08	0xB4	0x00	0x00	0x00	0x00	0x00	0x00	0x01	CRC16L CRC16H

Description: Data[7] = 1, which means the RS485 baud rate is changed to 500Kbps, and the CAN baud rate is changed to 1Mbps.

Example 3:

Send command:

CAN:

ID NO.	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0xB4	0x00	0x00	0x00	0x00	0x00	0x00	0x02

#### RS485:

Frame Header	ID NO.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0x01	0x08	0xB4	0x00	0x00	0x00	0x00	0x00	0x00	0x02	CRC16L CRC16H

Description: Data[7] = 2, which means the RS485 baud rate is changed to 1Mbps, and CAN is invalid.

# 2.30. Function control command (0x20)

# 2.30.1. Instruction description

This instruction is used to use some specific functions. It is a compound function instruction, which can contain multiple function control instructions.

# 2.30.2. Send data field definition

Data Field	Description	Data
DATA[0]	command byte	0x20
DATA[1]	function index	DATA[1] = (uint8_t)index
DATA[2]	NULL	0x00
DATA[3]	NULL	0x00
DATA[4]	Input parameter low byte 1	DATA[4] = (uint8_t)(Value)
DATA[5]	Input parameter low byte 2	DATA[5] = (uint8_t)(Value>>8)
DATA[6]	Input parameter low byte 3	DATA[6] = (uint8_t)(Value>>16)
DATA[7]	Input parameter low byte 4	DATA[7] = (uint8_t)(Value>>24)

# 2.30.3. Reply data field definition

The motor replies to the host computer after receiving the command, and the frame data is the same as the command sent by the host computer.

# 2.30.4. Function Index Description

Index value	Command name	Function description
0x01	Clear multi-turn	Clear motor multi-turn value, update zero point and
	value	save. It will take effect after restarting.
0x02	CANID filter Enable	The Value "1" means that the CANID filter is enabled,
		which can improve the efficiency of motor sending
		and receiving in CAN communication;
		The Value "0" represents the disabled CANID filter,
		which needs to be disabled when the multi-motor
		control command 0x280 is required;
		This value will be saved in FLASH, and the written
		value will be recorded after power off.

# 2.30.5. Communication example

# Example 1:

# Send command:

#### CAN:

ID号	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0x20	0x01	0x00	0x00	0x00	0x00	0x00	0x00

#### RS485:

帧头	ID号	长度	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16
											L	Н
0x3E	0x01	0x08	0x20	0x01	0x00	0x00	0x00	0x00	0x00	0x00	CRC16	CRC16
											L	Н

**Description:** Data[1] = 0x01, according to the index value table, the representative function is to clear the multi-turn value.

# **Command Reply:**

#### CAN:

ID号	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x241	0x20	0x01	0x00	0x00	0x00	0x00	0x00	0x00

#### RS485:

帧头	ID号	长度	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16
											L	н
0x3E	0x01	0x08	0x20	0x01	0x00	0x00	0x00	0x00	0x00	0x00	CRC16	CRC16
											L	н

**Description:** the frame data is the same as the command sent by the host.

# Example 2:

#### Send command:

## CAN:

ID号	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x141	0x20	0x02	0x00	0x00	0x01	0x00	0x00	0x00

#### RS485:

帧头	ID号	长度	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16
											L	Н
0x3E	0x01	0x08	0x20	0x02	0x00	0x00	0x01	0x00	0x00	0x00	CRC16	CRC16
											L	н

**Description:** Data[1] = 0x02, according to the index value table, the representative function is to enable the CANID filter. Note that the 0x280 multi-motor command cannot be used after enabling, and the CANID filter needs to be disabled before using the 0x280 command again.

#### **Command Reply:**

#### CAN:

ID号	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x241	0x20	0x02	0x00	0x00	0x01	0x00	0x00	0x00

#### RS485:

帧头	ID号	长度	D0	D1	D2	D3	D4	D5	D6	D7	CRC16	CRC16
											L	н
0x3E	0x01	0x08	0x20	0x02	0x00	0x00	0x01	0x00	0x00	0x00	CRC16	CRC16
											L	н

**Description:** The frame data is the same as the command sent by the host computer.

# 3. Multi-motor command (0x280 + command)

# 3.1. Instruction description

The ID number is 280, which means that multiple motors correspond to the same command at the same time. The content and function of the instruction are the same as those of the single-motor instruction. For details, please refer to the single-motor instruction.

# 3.2. Communication example

Suppose there are 4 motors on the CAN bus, and the ID numbers are 141, 142, 143, and 144 respectively.

# Example 1:

#### Send command:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x280	0x80	0x00						

# **Description:**

4 motors receive the 0x80 motor shutdown command at the same time (see 2.30 for details), and then all 4 motors immediately execute the motor shutdown command.

#### Reply command:

4 motors reply at the same time, and the reply ID is their own ID number respectively. The reply sequence depends on the respective delays on the bus.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x241	0x80	0x00						

#### **Description:**

The motor whose ID number is 0x241 returns the corresponding command.

ID Data[0] Data[1]	Data[2] Data	[3] Data[4] Data[5]	Data[6] Data[7]
--------------------	--------------	---------------------	-----------------

ı									
	0./2/2	000	0,,00	0,,00	0.,00	0,,00	0.,00	0,,00	000
	0x242	0x80	0x00	0x00	0x00	0x00	0x00	0x00	0x00

## **Description:**

The motor whose ID number is 0x242 returns the corresponding command.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x243	0x80	0x00						

#### Description:

The motor whose ID number is 0x243 returns the corresponding command.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x244	0x80	0x00						

#### **Description:**

The motor whose ID number is 0x244 returns the corresponding command.

## Example 2:

#### Send command:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x280	0x60	0x00						

## **Description:**

4 motors receive the 0x60 read multi-turn encoder position data command at the same time (see 2.21 for details), and then the 4 motors reply to their respective multi-turn encoder position data.

### Reply command:

4 motors reply at the same time, and the reply ID is their own ID number respectively. The reply sequence depends on the respective delays on the bus.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x241	0x60	0x00	0x00	0x00	0x10	0x27	0x00	0x00

#### **Description:**

The motor reply data with ID number 0x241 consists of Data[4] to data[7] (Data[4] is the lowest bit, Data[7] is the highest bit). The 32-bit data is 0x00002710, which means the decimal is 10000. The multi-turn encoder value representing the current relative multi-turn zero offset (initial position) of the motor is 10000 pulses.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x242	0x60	0x00	0x00	0x00	0x20	0x4E	0x00	0x00

#### **Description:**

The motor reply data with ID number 0x242 consists of Data[4] to data[7] (Data[4] is the lowest bit, Data[7] is the highest bit). The 32-bit data is 0x00004E20, which means 20000 in decimal. The multi-turn encoder value representing the current relative multi-turn zero offset (initial position) of the motor is 20000 pulses.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x243	0x60	0x00	0x00	0x00	0x30	0x75	0x00	0x00

#### Description:

The motor reply data with ID number 0x243 consists of Data[4] to data[7] (Data[4] is the lowest bit, Data[7] is the highest bit). The 32-bit data is 0x00007530, which means 30000 in decimal. The multi-turn encoder value representing the current relative multi-turn zero offset (initial position) of the motor is 30000 pulses.

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x244	0x60	0x00	0x00	0x00	0x40	0x9C	0x00	0x00

#### **Description**:

The motor reply data with ID number 0x244 consists of Data[4] to data[7] (Data[4] is the lowest bit, Data[7] is the highest bit). The 32-bit data is 0x00009C40, which means 40000 in decimal. The multi-turn encoder value representing the current relative multi-turn zero offset (initial position) of the motor is 40000 pulses.

# 4. CANID setting command (0x79)

# 4.1. Instruction description

This command is used to set and read CAN ID.

The host sends this command to set and read the CAN ID, the parameters are as follows.

- 1. The read and write flag bit wReadWriteFlag is bool type, 1 read 0 write.
- 2. CANID, size range (#1~#32), uint16\_t type (synchronized with the upper computer function), device identifier 0x140 + ID (1~32).

#### 4.2. Send data field definition

data field	Description	data
DATA[0]	command byte	0x79
DATA[1]	NULL	0x00
DATA[2]	read and write flags	DATA[2] = wReadWriteFlag
DATA[3]	NULL	0x00
DATA[4]	NULL	0x00
DATA[5]	NULL	0x00
DATA[6]	NULL	0x00
DATA[7]	CANID	DATA[7] = CANID(1~32)

# 4.3. Reply data field definition

- 1. The motor replies to the host after receiving the command, which is divided into the following two situations:
- 2. Set CANID, the range is 1-32, and return to the original command.
- 3. Read CANID, the return parameters are as follows.

data field	Description	data
DATA[0]	command byte	0x79
DATA[0]	NULL	0x00
DATA[0]	read and write flags	DATA[2] = wReadWriteFlag

DATA[0]	NULL	0x00
DATA[4]	NULL	0x00
DATA[5]	NULL	0x00
DATA[6]	CANID low byte1	DATA[6] = (uint8_t *)(CANID)
DATA[7]	CANID byte2	DATA[7] = (uint8_t)(CANID>>8)

# 4.4. Communication example

# **Example 1:**

## Send command:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x300	0x79	0x00	0x00	0x00	0x00	0x00	0x00	0x02

# **Description:**

Data[2] = 0 means write CANID. Data[7] = 1 means that the motor CANID is set to 2, that is, the send ID is 0x142, and the reply ID is 0x242.

# **Reply command:**

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x300	0x79	0x00	0x00	0x00	0x00	0x00	0x00	0x02

# **Description:**

Same as sending command.

# Example 2:

#### Send command:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x300	0x79	0x00	0x01	0x00	0x00	0x00	0x00	0x00

# **Description:**

Data[2] = 1 means reading CANID.

# Reply command:

ID	Data[0]	Data[1]	Data[2]	Data[3]	Data[4]	Data[5]	Data[6]	Data[7]
0x300	0x79	0x00	0x01	0x00	0x00	0x00	0x42	0x02

# **Description:**

Data[6] and Data[7] form 0x242, which means that the motor send ID is 0x142, and the reply ID is 0x242.

# 5.Motion Mode Control Command\_CAN (0x400 + ID) 5.1. Instruction Description

The command consists of 5 input parameters:

p des (desired position),

v des(desired velocity),

t ff (feedforward torque),

kp (position deviation coefficient),

kd (speed deviation coefficient).

Each parameter has a preset range size:

p\_des: -12.5 to 12.5 in rad; v\_des: -45 to 45, in rad/s; t\_ff: -24 to 24, unit N-m;

kp: 0 to 500; kd: 0 to 5;

Function expression:  $lqRef = [kp*(p\_des - p\_fd\_actual position) + kd*(v\_des - v\_fb\_actual speed) + t\_ff]*KT\_torque coefficient; <math>lqRef$  is the output current of the last given motor.

# 6. RS485-ID setting command (0x79)

# **6.1. Instruction Description**

This command is used to set and read RS485 ID. Communication ID uses 0xCD, all devices on the bus will receive and process this command, When modifying, you need to pay attention to whether multiple devices are connected, so that the IDs of multiple devices may be modified to the same at the same time.

The host sends this command to set and read the RS485 ID, the parameters are as follows.

- 3. The read and write flag bit wReadWriteFlag is bool type, 1 read 0 write.
- 4. RS485-ID, size range (#1~#32), uint16\_t type (synchronized with the upper computer function), device identifier ID (1~32).

## 6.2. Send Data Field Definition

Data field	Explanation	Data
DATA[0]	command byte	0x79
DATA[1]	NULL	0x00
DATA[2]	read and write flags	DATA[2] = wReadWriteFlag
DATA[3]	NULL	0x00
DATA[4]	NULL	0x00
DATA[5]	NULL	0x00
DATA[6]	NULL	0x00
DATA[7]	RS485ID	DATA[7] = RS485ID(1~32)

# 6.3. Reply data field definition

- 4. The motor replies to the host after receiving the command, which is divided into the following two situations:
- 5. Set RS485ID, the range is 1-32, and return to the original command.
- 6. Read RS485ID, the return parameters are as follows.

Data field	Explanation	Data
DATA[0]	command byte	0x79
DATA[1]	NULL	0x00
DATA[2]	read and write flags	DATA[2] = wReadWriteFlag
DATA[3]	NULL	0x00
DATA[4]	NULL	0x00
DATA[5]	NULL	0x00
DATA[6]	RS485 Low byte 1	DATA[6] = (uint8_t *)(RS485ID)
DATA[7]	RS485 ID 2	DATA[7] = (uint8_t)(RS485ID>>8)

# **6.4. Communication example**

#### Example 1:

Send command:

Frame Header	ID No.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0xCD	0x08	0x79	0x00	0x00	0x00	0x00	0x00	0x00	0x02	CRC16L CRC16H

Description: Data[2] = 0 means write RS485ID. Data[7] = 1 means to set the motor RS485ID to 2.

#### Reply command:

Frame Header	ID No.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0xCD	0x08	0x79	0x00	0x00	0x00	0x00	0x00	0x00	0x02	CRC16L CRC16H

Description: Same as sending command.

## Example 2:

#### Send command:

Frame Header	ID No.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0xCD	0x08	0x79	0x00	0x01	0x00	0x00	0x00	0x00	0x00	CRC16L CRC16H

Description: Data[2] = 1 means to read RS485ID.

#### Reply command:

Frame Header	ID No.	Length	D0	D1	D2	D3	D4	D5	D6	D7	CRC16L CRC16H
0x3E	0xCD	0x08	0x79	0x00	0x01	0x00	0x00	0x00	0x00	0x02	CRC16L CRC16H

# 7.Indicator Light Description

# 7.1 Status Description

- ·When the indicator light is solid on, it means the motor is running normally;
- ·Slow flashing indicates that the motor has a secondary error. If the recovery condition is reached, it will automatically return to normal operation, and the indicator light will be solid on for a long time;
- ·Flickering quickly indicates that the motor has a first-level error, and the motor cannot recover from the error. It is necessary to check the motor fault and restart before it can continue to run;

# 7.2 Failure Description Form

Fault Name	Description	Error Level
Hardware over-current	If the motor current exceeds the limit value, there may be short circuit, phase loss, loss of control, motor damage, etc.	Level 1
Stall error	After the current reaches the stall current, the speed is very low and continues for a period of time. Indicates that the motor load is too large.	Level 1

Under-voltage error	The power input is lower than the set undervoltage value	Level 2
Over-voltage error	The power input is higher than the set overvoltage value	Level 2
Phase-current over- current	The software detects that the motor current exceeds the limit value, and there may be short circuit, phase loss, loss of control, motor damage, etc.	Level 1
Power overrun error	If the input current of the power supply exceeds the limit value, there may be a situation where the load is too large or the speed is too high.	Level 2
Calibration parameter read error	Failed to write parameters causing parameter loss.	Level 1
Over-speed error	The motor running speed exceeds the limit value, there may be overpressure and drag use.	Level 2
Motor over-temperature error	If the motor temperature exceeds the set value, there may be short circuit, parameter error, and long-term overload use.	Level 2
Encoder calibration error	The encoder calibration result deviates too much from the standard value.	Level 2

# 8. Version revision information Version V3.1:

- 1) Version revision content:
- a. Revise the definition of reply data in 5.0 operation control command;
- 2) Version revision date: 2022.6.23

# Version V3.2:

- 1) Version revision content:
- a. Add the description of indicator lights;
- 2) Version revision date: 2022.7.27

# **Version V3.3:**

# 1) Version revision content:

- a. Add function control command 0x20 a function: add CAN filter disable control function;
- 2) Version revision date: 2022.7.31
